Seller retains the right to adjust this table during the construction of the infrastructure if it becomes apparent that the actual height of the terrain is different from the height of the isobases (elevation lines) on the General Situation and plan drawing BON0701-V01, Rev 3. The isobases in that plan were determined in 1990 by stereoscopic aerial cartography. Buyer must ascertain the elevation of his terrain using reference heights provided by the seller on top of the utility niches prior to starting construction.
